This document outlines the development process of my portfolio website, including planning, implementation and reflection.

1. Planning and Evidence

Before starting the development of my website, I created a mood board to help decide on the overall style and layout. I explored different design ideas, including the use of images and layouts, before deciding on a clean and minimal approach. I chose a dark theme with a purple accent colour to create a modern and professional appearance. I also selected a simple font to ensure readability.

During the planning stage, I also considered how users would navigate the website and how information would be organised across different pages. I wanted to ensure that each page had a clear purpose and that users could easily move between sections using the navigation bar.

This planning stage helped me visualise how the website would look and ensured that the design remained consistent across all pages. It also made the development process easier, as I already had a clear idea of how the website should be structured before beginning the coding process.

Site map:

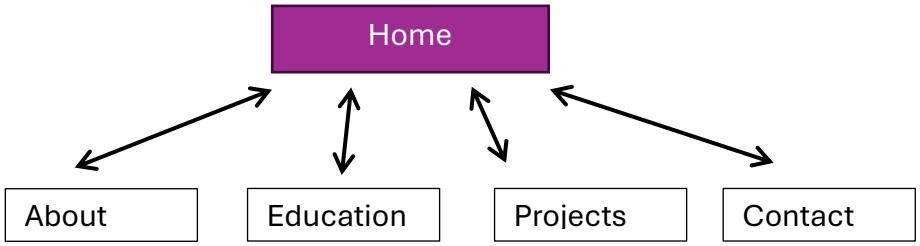

Figure 2: Site map showing the structure of the website

This site map shows the structure of my website. The homepage acts as the main entry point, with navigation links to the About, Education, Projects and contact pages. This structure ensures that users can easily navigate between all areas of the website.

Wireframe:

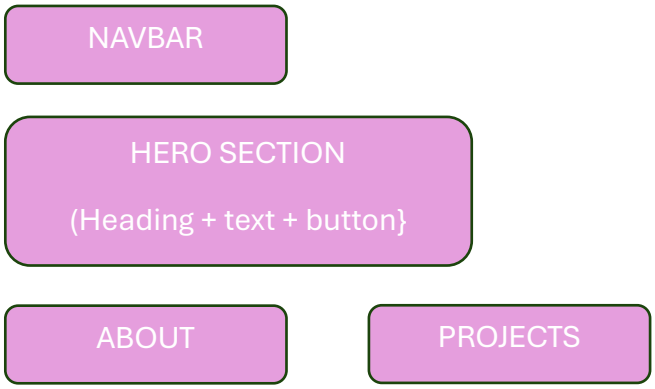

Figure 3: Wireframe showing the layout of the homepage.

The wireframe shows the basic layout of the homepage. It includes a navigation bar at the top, followed by a hero section with a heading, text and button. Below this, there are two sections displayed side by side to present key information. This layout was chosen to keep the design simple and easy to navigate.

2. Development Stages

Stage 1 – Initial HTML Structure

Date: 10/04/2026

In this stage, I created the basic structure of my website using HTML. I developed multiple pages, including Home, About, Education, Projects and Contact. Each page was linked using navigation links to allow users to move between them easily.

This stage focused on ensuring that all pages were created and connected correctly before adding any styling.

This stage was important because it provided a clear foundation for the rest of the development. By setting up all pages early, I was able to focus on improving the design and functionality in later stages without needing to restructure the website.

Stage 2 – Adding the CSS Styling

Date: 11/04/2026

In this stage, I added CSS to improve the appearance of the website. I created an external stylesheet and linked it to all HTML pages. I applied a dark background with a purple accent colour to create a modern and consistent design.

I also styled text, headings, links and buttons to improve readability and visual appeal. I ensured that the styling was consistent across all pages by linking the same CSS file. This helped create a uniform appearance and improved the overall user experience. Applying colour and layout at this stage made a noticeable difference compared to the initial plain structure.

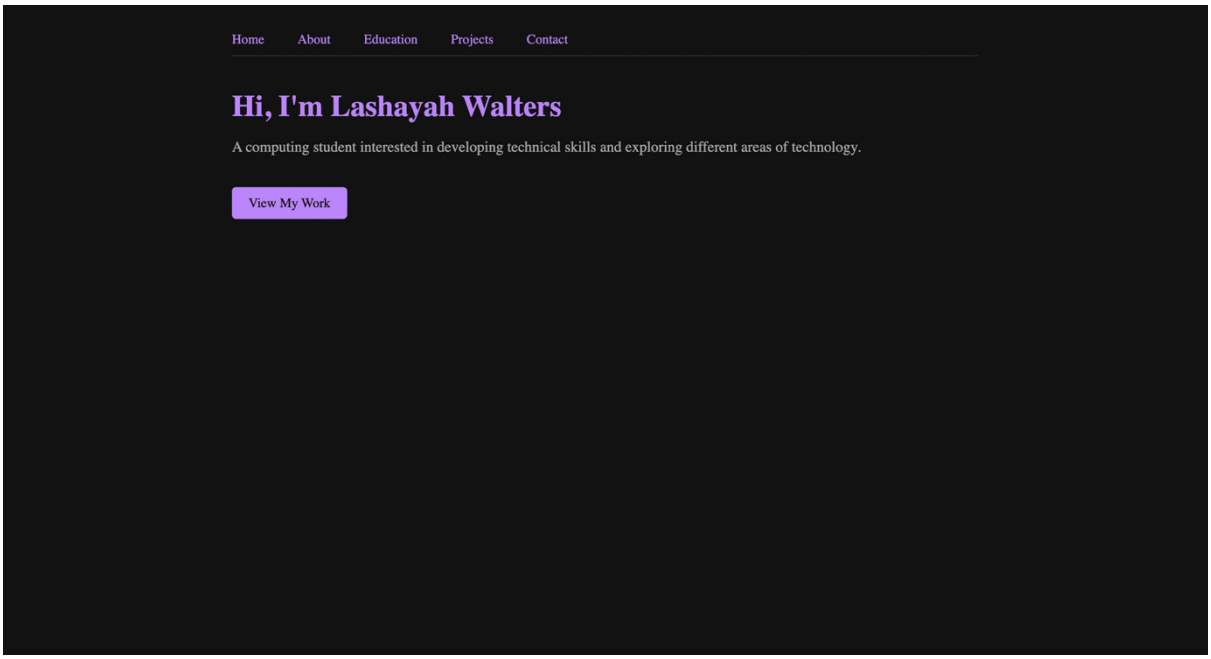

Figure 5: Website after applying CSS styling, showing colour scheme and improved design.

```
body {
  background-color: #121212;
  color: #ffffff;
}

h1 {
  color: #bb86fc;
}
```

Stage 3 – Layout and Navigation

Date: 12/04/2026

In this stage, I improved the layout and navigation of the website to make it more structured and user-friendly. I created a navigation bar and ensured it was consistent across all pages, allowing users to easily move between sections.

I also used CSS to improve the layout by organising content into sections and placing elements side by side using Flexbox. This helped create a more professional and visually appealing design.

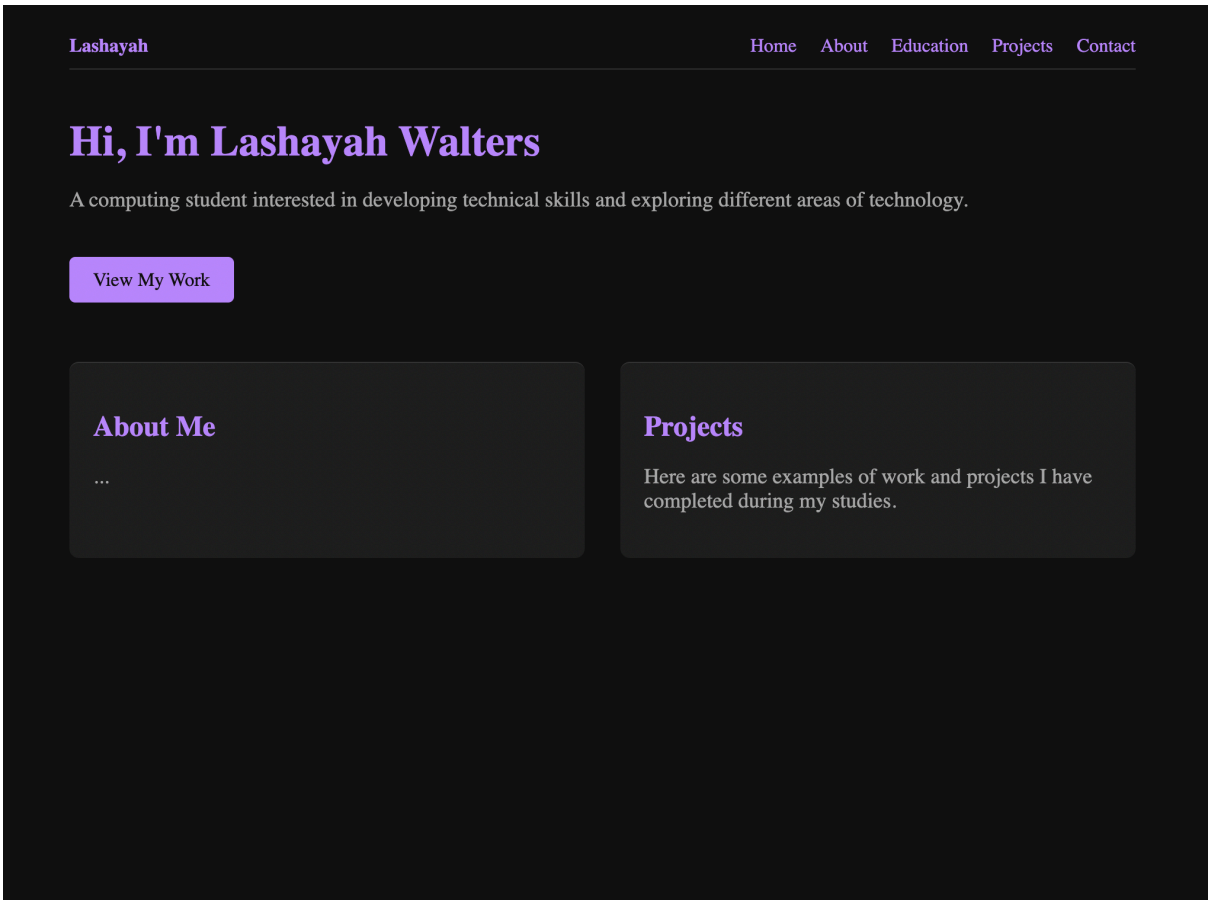

Figure 6: Improved layout and navigation showing structure sections and consistent design across the website.

```
nav {
  display: flex;
  justify-content: space-between;
  align-items: center;
}

.sections {
  display: flex;
  gap: 30px;
}
```

Stage 4 - Adding JavaScript

Date: 14/04/2026

In this stage, I added JavaScript to make the website more interactive. I created a simple feature where a message appears when the “View My Work” button is clicked.

This helped me understand how JavaScript can be used alongside HTML and CSS to add interactivity. It also made the website feel more engaging rather than just static.

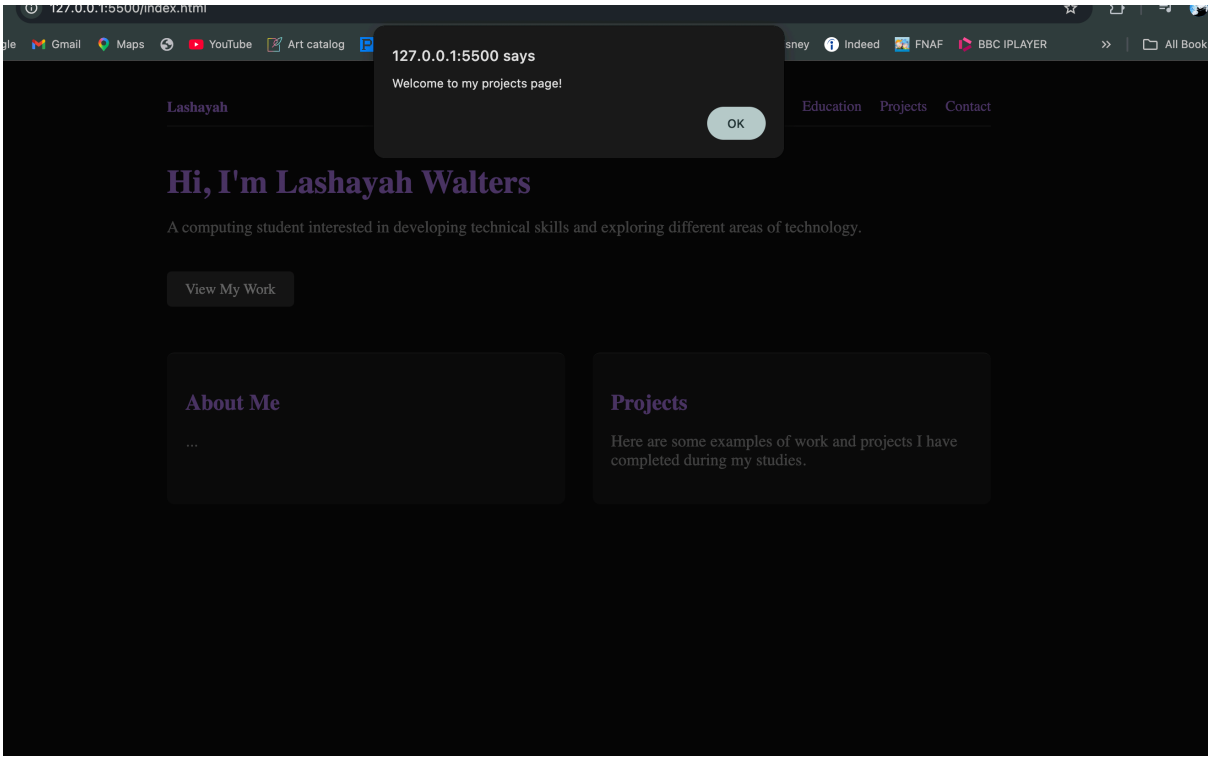

Figure 7: JavaScript feature showing a message when the button is clicked.

```
const button = document.querySelector(".btn");

button.addEventListener("click", function () {
  alert("Welcome to my projects page!");
});
```

Stage 5 – Final Design and Content

Date: 16/04/2026

In this stage, I finalised the design and added content to all pages. I ensured that each page included relevant information, such as details about my studies, skills, projects and contact information.

I also made final improvements to the layout and design to make sure everything was consistent and easy to navigate. This stage helped bring the whole website together and made it ready for submission.

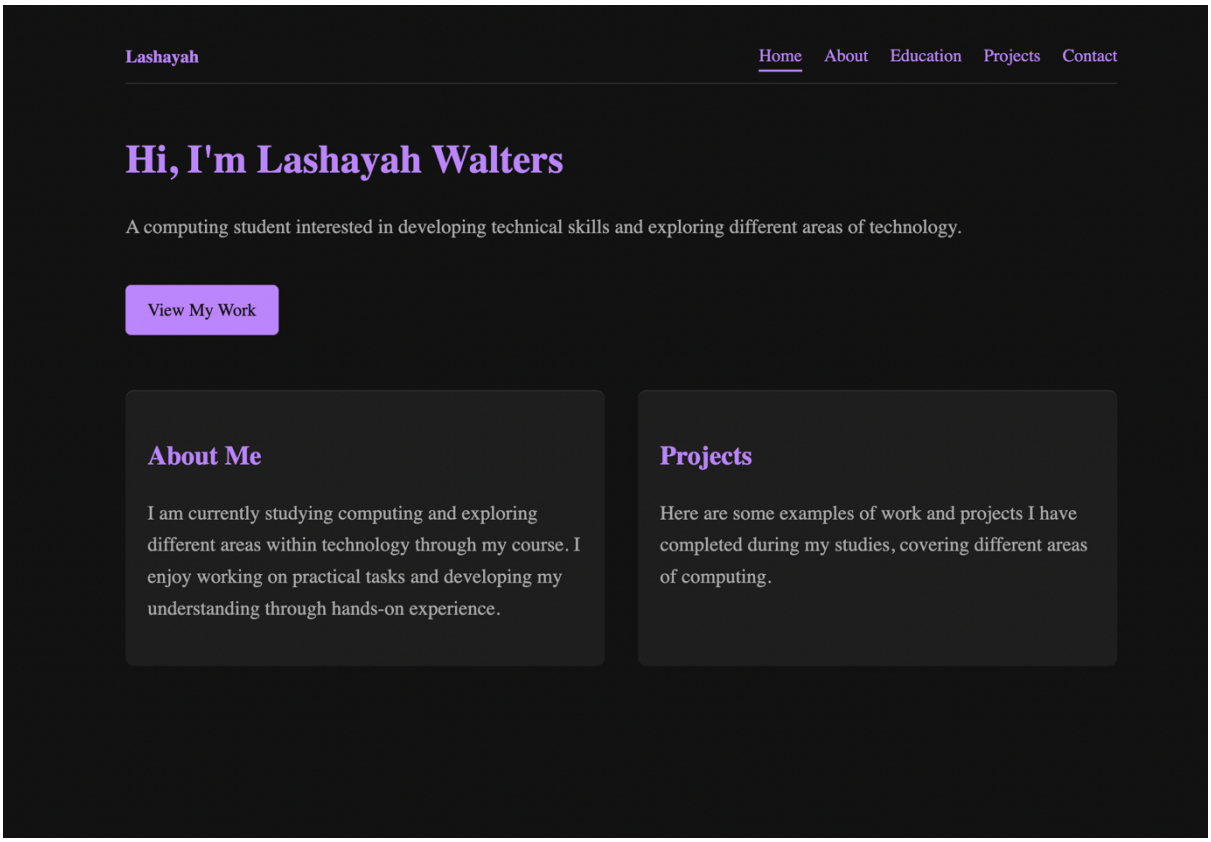

Figure 8: Final version of the website showing completed design and content.

```
<div class="section">
  <h2>Projects</h2>
  <p>Here are some examples of work and projects I have completed during my studies.</p>
</div>
```

3. Reflective Discussion

Overall, I am pleased with the outcome of my website, I was able to create a fully working portfolio with multiple pages, consistent design and clear navigation. I think the layout and colour scheme worked well, as it gives the website a modern and professional appearance.

One challenge I faced was learning how to structure the layout using CSS, especially when positioning elements and making the design look organised. At first, it was difficult to understand how different layout techniques worked, but through practice and adjusting, I was able to improve the layout and make it more visually appealing.

Another challenge was ensuring that all pages were consistent and linked correctly. I had to carefully check my navigation and file structure to make sure everything worked properly across the whole website.

If I were to improve the website further, I would consider adding more features such as images or more advanced interactivity, I would also continue developing my skills to improve the overall design and functionality of the website.

This project has helped me develop my understanding of HTML, CSS and JavaScript, and has improved my confidence in creating a complete website. It has also helped me improve my problem-solving skills, as I had to test and adjust my code multiple times to achieve the desired result.
